

E01

For the exercise on the `hello-5` module, the first thing to do is to compile the source files using the provided `Makefile` (`make` command). In order to install the compiled module on the system, we have to use the generated `.ko` file. Since the installation of the module requires super user privileges, we first type `sudo su` and then the command for installing the module (`insmod hello-5.ko`).

The module is installed in the `/sys/module/hello-5/` directory. The output of the installation can be easily retrieved from `/var/log/messages` using `cat` or `tail` commands.

If we want to remove the module, we can type in the command `rmmod hello-5`.
